matrix known as plasma. Learn more about the components and function of blood.

blood | Definition, Composition, & Functions | Britannica

Blood is composed of 55% plasma and 45% "formed elements," including red blood cells, white blood cells, and platelets. Because of these living cells suspended in the plasma, blood is considered a fluid connective tissue (not a fluid). It is the only fluid tissue in the body. 2. Blood Provides the Body's Cells with Oxygen and Removes Carbon ...

secretions of an infected person.

Blood - Wikipedia

Blood is an extracellular matrix tissue in which various blood cells are suspended in the plasma matrix. Blood is vital for normal metabolic function due to the transfer of oxygen, carbon dioxide, and glucose to and from the body's tissues. It also transports a number of other cells and molecules throughout the body. Key Terms

Overview of Blood | Boundless Anatomy and Physiology

Shock is the state of insufficient blood flow to the tissues of the body as a result of problems with the circulatory system. Initial symptoms of shock may include weakness, fast heart rate, fast breathing, sweating, anxiety, and increased thirst. This may be followed by confusion, unconsciousness, or cardiac arrest, as complications worsen. ...

Your blood has a normal pH range of 7.35 to 7.45. This means that blood is naturally slightly alkaline or basic. In comparison, your stomach acid has a pH of around 1.5 to 3.5. This makes it acidic.

Normal pH of Blood in Humans: What Actions Affect It?

This list concerns blood type distribution between countries and regions. Blood type (also called a blood group) is a classification of blood, based on the presence and absence of antibodies and inherited antigenic substances on the surface of red blood cells (RBCs). These antigens may be proteins, carbohydrates, glycoproteins, or glycolipids, depending on the blood group system.

Blood type distribution by country - Wikipedia
