The multi-objective optimization strategy chosen in this work is based on the decomposition of the optimization problem in master and slave sub-problems (Fig. 1) (Gassner and Maréchal, 2009). The two objectives are minimizing the operating costs of the industrial process and the investment costs related to new heat pump installations.

□Another multiobjective mathematical “programming” technique is Goal Programming (GP) □The term "goal programming" is used by its developers to indicate the search for an "optimal" program (i.e., a set of policies to be implemented) for a mathematical model that is composed solely of goals.

The optimization of portfolios is an example of multi-objective optimization in economics. Since the 1970s, economists have modeled dynamic decisions over time using control theory. For example, dynamic search models are used to study labor-market behavior. A crucial distinction is between deterministic and stochastic models.

In civil and industrial engineering, structural design optimization problems are usually characterized by the presence of multiple conflicting objectives, as to get the minimum investment cost and the maximum safety of the final design. This issue makes these problems to have not only one single solution, but a set them.
