The Drawworks And The Compound
The drawworks is a part of the system that rotary drilling rigs use for hoisting, or lifting, the drill stem and casing out of the hole. A compounding transmission, or compound, sends power from the engines to the drawworks, the rotary table, and the mud pumps.

The drawworks have however large footprints, i.e., 48-ft (14.6 m) long, 12-ft (3.5 m) wide, and 17-ft (6 m) tall, and weigh more than 340,000 lbs (170 ton) driven via six AC motors, each producing 1500 hp continuously. The main DMC advantage is when handling larger (subsea BOP or casing) loads.

Mechanical Drive Systems. Most early drilling rigs used a mechanical drive system to transmit power from the engines to the operating equipment such as the drawworks and pumps. The drive system consists of gears, chains, and belts (Fig. 16—18). The compound device attached to the engine shafts combines the output of two engines.
