Voltage Sag.

Description: A

decrease of the normal voltage level between 10% and 90% of the nominal rms voltage at the power frequency, for durations of 0,5 cycle to 1 minute.

Causes: Faults on the transmission or distribution network (most of the times on parallel feeders). Faults in consumer's

Voltage Sag or Voltage

Dip (IEC term) is

defined by the IEEE

1159 as the decrease

in the RMS voltage

level to 10% - 90% (1%

- 90% for EN 50160) of

nominal, at the power

frequency for durations

of $\frac{1}{2}$ cycle to one (1)

minute. Also, voltage

sag is classified as a

short duration voltage

variation phenomena,

which is one of the

general categories of

power quality

problems.

Electric power quality

is the degree to which

the voltage, frequency,

and waveform of a

power supply system conform to established specifications. Good

power quality can be

defined as a steady

supply voltage that

stays within the

prescribed range,

steady a.c. frequency

close to the rated

value, and smooth

voltage curve

waveform (resembles a

sine wave).
